Dear netters,

Currently I am writing a routine to display some images with widgets provided in PV-Wave. However, I got some problems: what I want to do is to define two draw areas which are used for displaying images, and one of the draw areas will be selected by mouse click and then display the image in the selected draw area. I have tried to use the WTADDHANDLER to handle the mouse click event, and try to obtain the window index by that, but it doesn't work. How to do that ? Thanks to those who help me.

KP
