Subject: multi-layer tiff file

Anyone know a way to generate a multi-layer tiff from IDL (or any other format which would open in photoshop with images in separate layers)? I tried this:

```
IDL> a=dist(400)
IDL> b=bytscl(findgen(400,400))
IDL> c=[[[a]],[[b]]]
IDL> write_tiff,"d:\tmp\test.tif",c,planarconfig=2
```

but Photoshop doesn't like it (although Photoshop can read/write multi-layer tiffs). I'm hoping to create a ~100 layer image file.

cheers,
Greg
