Hi Mike,

this is all quite promising. I gave it a try and the problem in your
example seems related to the use of "s" as variable name. Changing "s"
to "ts" made it work for me. i.e:

%%idl
s = 'Hello world!'
print, s

prints: "Hello world!"

But on the next cell a simple:
$$idl
print, s

prints a long array

but:

%%idl
ts = 'Hello world!'

%%idl
print, ts

works as expected.

I also tried to convert pIDLy and idlmagic to python3 but it's still too
complicated for me as I am a python newbie...

Anyways, all this is quite exiting.

Cheers,

Fabien
