Does anyone have helpful hints for using Matlab and PVWave together?

I use matlab on a PC and sometimes need the extra resources of a workstation.

The graphics of PVwave seem excellent, but I am already familiar with Matlab and prefer using it for data manipulation. However, I wish to explore the graphic capabilities of PVWave and thought others might know some helpful tricks of combining these two software packages. If not, I will stick with Matlab because I do not have enough time to convert my work to PVwave.

Please respond via email to pwm@macaw.jhuapl.edu

Thanks,

Phil Miller
