> Thank you.

That depends on the function that returns the function you are fitting, the name of which you passed to mpfitfun. If it returns $p[0] + p[1]*X$ (which would make sense to me) then perror[0] corresponds the error in b and perror[1] the error in a.

But if you made it return $p[0]*X + p[1]$, then the order of the errors is the opposite.
