This discussion ultimately ends with the Execute command, which most agree is a very bad option for naming variables. Instead, try using a list, structure, or concatenated array:

;List

myList = list()

myList(1) -> Add, fltarr(nc, nr)

myList(2) -> Add, fltarr(nc, nr)

;Array

myArr = [[[fltarr(nc, nr)]], [[fltarr(nc, nr)]]]

;Structure

myStruct = create_struct('Tag1', fltarr(nc, nr), 'Tag2', fltarr(nc, nr))
