I want to translate points on the earth's surface [pairs of lat,long, or X,Y] among different coordinate systems. Especially lat long [WGS-84] to and from UTM in NAD-83 and NAD-27.

I have studied Map_set, Map_Patch,... enough to understand they will not do this. IDL tech support says their ENVI product will do this, but I don't have \$\$\$ for that. Does anyone know of software tools in IDL or any language [I'll translate] that will convert map projections?

Thanks,
Joe Means
