Subject: How to check for existence of an HDF5 group

Dear Folks,

I want to create new groups within an HDF5 file. Before creating a new group, however, I'd like to check whether a group of the same name already exists. What's the right way to do this?

Calling `H5G_OPEN` or `H5G_GET_OBJINFO` with a new group name throws an error. I could write a wrapper routine that catches the error and returns a "group not found" value but that seems kludgy.

`H5_LIST` returns a whole lot of information, which I suppose I could parse. That also seems clunky.

Is there a more elegant solution? Something along the lines of `FILE_TEST` that works for HDF5 groups (`H5G_TEST`, e.g.)?

All the best,

David
