Hi

I am now trying to use some user contributed programs that I downloaded from PV-Wave website. However, I found that some of the programs are not compatible with the current version of PV-Wave (v5.00) that I used. I got one program which is a widget program for defining region of interest, and I found that there are some statements needed to call Wwhandler to handle the mouse button events. I want to know how to use (the calling format) the wwhandler, and if it can be replaced by another event handler - WtAddhandler ? Any help ?? Thanks !!!

KP
