There is one thing I don't understand. Both of you suggest the same thing:

`a = reform(a, 100l, 200l*2l, /overwrite)`

You typed `200l*2l` this is because we want 200x200 that's why you multiplied it by 2?

What I want it's 100 x (200x200). So 100 2D images of dimensions [200,200]
