Folks,

I reported an observation this morning about tracking events on my WindowsNT machine being a bit unreliable. I've heard from Mark Leaming, one of RSI's Windows developers, about the situation. He has given me permission to post his reply to this newsgroup.

He writes:

- > Unlike MOTIF, Windows doesn't have a concept of "tracking" events
- > rather Windows uses mouse click events to indicate a change of focus.

- > We currently fake tracking events, but are constrained by lack of
- > support in the windowing system. To support tracking the widgets
- > currently respond to the WM_MOUSEMOVE and WM_NCMOUSEMOVE messages.
- > When the mouse is moved quickly, these messages are not sent but
- > rather compressed by the window system and you don't get the tracking
- > event. There are other constraints imposed by the windowing system
- > that currently limit our tracking support on windows.

- > We have a design for fixing this but the work involved was too
- > significant to get into 5.0 so it should be in the next release
- > of IDL (5.1).

It ought to be fairly easy to work around this problem until the fix is available. Thanks for the information, Mark.

Cheers,

David
