
Subject: Perform 'find' command (LINUX) in IDL environment

Hey there!

For reasons of processing time I'd like to replace a 'FILE_SEARCH' command with a faster 'find' LINUX command.

Here is what I have so far...

```
mydir = 'F:\startdir\anotherdir\maindir\data'  
cd, mydir  
spawn, 'pwd'  
spawn, 'find' -type f -name "*132.txt"
```

The result should be every text file ending with "132.txt".

Where am I going wrong here?

Thanks,
Kai
