
Subject: widget arrangement under IDL 5

I have several widgets that show strange behavior in IDL 5.0 under Win95. I have several child widgets (children widgets? :-)) that are arranged in three rows in a base widget, they are of greatly varying sizes. In IDL 4 the widgets were distributed according to their size (one row after the other filled). In IDL 5 they seem to be distributed solely according to their number regardless of their size, which results in some truly ugly widgets. Is there any way around this?
