I'm trying to determine if there is a simple way to control the y-axis labels when using the relative frequency keyword with cgHistoplot.

I know IDL format codes can be used with the ytickformat keyword, however what I am hoping to do is display the relative frequency as a percentage instead of in decimal form. (e.g. 1.5% versus 0.015)

The simplest option would be a keyword to set the y axis to be in %, however it doesn't appear that's possible. Does anyone know if there a way to output the label values used to an array? That way they can be converted to a percentage and then be explicitly set using the yticknames keyword?
