Why don't you just keep reading? The documentation will explain the arguments to you, the order in which they should be placed after the name of the command, and the purpose and name of each of the keywords you can use.

Honestly, if you can't figure this out on your own (perhaps with a bit of experimentation), you will never be able to use IDL. You should give up now and save yourself immense frustration. I say this in the kindest way possible. :-)

Cheers,

David
