---

The output in the FORTRAN file wrote like this:

```
-----  
  
real, x(10, 722, 144)  
  
open(21, file='result.dat', form='unformatted')  
...(some calculation about x)  
write(21) x  
close(21)  
  
-----
```

and reading program in IDL is like this:

```
-----  
  
data=fltarr(10,722,144)  
openr, lun, 'result.dat', /get_lun, /f77_unformatted  
readu, lun, data  
free_lun,lun  
  
-----
```

But it looks like these code cannot read the file "result.dat" into the array "data". Where is the problem? Thanks!
