Subject: end of file in the middle of a text file

I've got an IDL program that seems perfectly capable of reading a number of different text files, but there is one file where it encounters an EOF in the middle of the file.

It reads right up to the middle of the file. I know where it's reading to because I printed out each line it read in. I know it's in the middle of the text file because I can open the text in notepad and see that there's more file left.

So as far as I can tell, it's nowhere near the end of the file. Is there anything that might be embedded in the text file that's causing this to happen? If there was, would there be a way to tell the IDL program to skip over that?

I cleared a bunch of room of my hard drive as well, in hopes that it was just an issue of space. That didn't fix anything. Doesn't matter where in the line up I run this particular text file, the program still has problems with it when the others don't.

Thanks
