Hi, all

I found a problem with ncdf on different operation systems.

The problem is placed on wfw311 and win NT Workstation for PC

The problem doesn't occure on UNIX-AIX or win95 PC.

Description:

The write process fails sometimes, because sometimes the file save path isn't the same as the one where the temporary files are builded.

There are two errors possible.

1) It seems thats if the temporary file is created it didn't found it's destination.

OR

2)it will try to create the temporary file in a path where is no write access available.

Who has ideas to fix this problem?
