\*new user here!

So I have a set of scans that make up one 'run', and I have a loop that calculates a certain value for each scan. I want to plot that value against the longitude of the scan, so that at the end I get a graph that plots the value vs. the longitude on one graph for all the scans in that run. If you need clarification let me know!

I've got the variables figured out, but it doesn't want to let me plot a singular point on a graph, and then loop over it and plot more singular points on that same graph. I've tried just the plots command, with no luck.

Thanks for the help!
