Hi Mike,

Would you happen to know how to grab corner lat longs from a geotiff image?
Currently, I'm able to get just one such point from the tiff structure "MODELTIMEPOINTTAG".

Ex: print,tiff_tags.MODELTIMEPOINTTAG

```
0.00000000  0.00000000  0.00000000  -82.399429  41.402946  0.00000000
```

These lat-longs are essential for google static maps to draw a bounding box over the 250x250 map headlessly.

Regards,
Puneeth
