my datas are organized in columns. In first column i have days of year, with 355 lines. In second
column I have dates, with 355 lines of datas and from third i have 24 columns with temperature,
with 355 lines.
1 01/01/2010 13,4   22,3 ... 353
2 02/01/2010 21   321   ... 245
.   .   .   .   .
.   .   .   .   .
.   .   .   .   .
355 21/12/2010   15   124   ... 193,3

I am getting just to read the first, the second and the tirdh column, but i need to create a array with
all columns starting of third, obtain a array tem[24,355], but I am starting with IDL. I am sorry for

my english, I am brasilian.
