Hey all,

Does anyone know of a way to plot a curtain of data, but then get it to load into Google Earth.
A curtain of data would be a Lidar or Radar return from a satellite or airplane pointing nadir.
I think it can best be thought of as a 4D data set [lat, long, altitude, data-value]
I've tried overplotting 3D-plots onto a projected map object to force it to have a z-axis, but this
doesn't work.

Any thoughts?

Thanks,
Scott
