hi

idlneturl object is not working on the idl workbench.

but it is working on the idl command line(not workbench console).

here is the example code

```
url = idlneturl()
print, url.getftpdirlist(url='ftp://ftp.swpc.noaa.gov/pub/lists/particle/')
```

error message of workbench is

```
% IDLNETURL::GETFTPDIRLIST: CCurlException: Error: Ftp Dir Request Failed. Error = RETR
response: 425,
```

```
      Curl Error Code = 19. Last Ftp Response = 425 Unable to build data connection:
Connection
      timed out
```

```
% Execution halted at: $MAIN$
```

say again, it is working only idl command line.

idl 8.5, windows 64bit.

Thanks.
