There is nothing particularly magical about cgGeoMosaic. It is not a very sophisticated program. I can think of about 10 better ways to write it just off the top of my head. It's a memory hog, for sure. I wrote it one afternoon to do a particular job for me and thought others might find it useful.

In principle, you could write a loop through your files, mosaicking the n-1 output with the nth image. I don't see any particular reason that wouldn't work, and if this is a one-off, efficiency is probably overrated. You could delete the intermediate files that would get created in your loop, unless you wanted to examine them for some reason.

The loop might take 10 minutes to write. It's worth a try as a first step. Unless, of course, this is not a one-off. Then you will probably want to forge a different solution.

Cheers,

David
