Subject: Breaking a large program file
Posted by Rosie on Thu, 24 Sep 2015 11:39:31 GMT

Hello,

I am using a very large program file which takes 15 min to complete one run. The final part is generating contours globally out of data from mathematical calculations (first part).

Can anyone help me on how to separate those two parts, so that I can store and use the data from mathematical part to analyse lots of graphical details later. It will save lots of time.

Regards,
