Hi,

I really learn a lot from your answers.

So I am just starting to use the IDL_IDLbridge to do parallel computing.

And when I execute a child process, the child process can not run another self-defined pro or
funcs. The output show as " Attempt to call undefined procedure/function: run2"

So can you give me some help? Thanks.

Example:

obj->execute,'run1';

pro run1

run2

end

pro run2

window,0

end
