Hello,
we use IMSL/IDL on Unix and VMS and would like to read
GIF-files directly without converting them to TIFF
before. I received the source code of the routines
READ_GIF and WRITE_GIF, but the kernel routines
        DECODE_GIF,unit,image   and ENCODE_GIF
are missing. Does anybody know, how to obtain these
routines, or at least how to write them? If possible,
please send code to
        preusser@fhi-berlin.mpg.de
Thank you.
