Subject: Looping through structures
Posted by wdolan on Tue, 01 Mar 2016 17:53:17 GMT

So I am analyzing a years worth of data, which I got in the form of structures for each month.

For example

StrucJan has arrays (is tags the correct word?) called, lon, lat, gas_conc (we are measuring gas concentration). And StrucFeb also has the tags lon, lat, and gas_conc. Each month is in the same format.

I've got a bunch of code that does calculations with the January data. But I'm not sure how to loop over it so it does all the same calculations with the February data, and then the march, april, may etc. data (all of which are in the same format with the exact same tags).

Hopefully this makes sense!

Any ideas?
