
Subject: ZOOM in IDL 5.0

Hi,

I wrote a program in IDL 4.0. In the main event handler, I call the ZOOM procedure, which works OK. When I run the same program (4.0 code) under IDL 5.0, it halts when calling the ZOOM procedure. The distributor said that it had something to do with combining two message loops: one of ZOOM and one of XMANAGER. What does this mean, and why does it work under IDL 4.0 and not under 5.0 ?

Thanks,

Alrik.
