Not sure what you want. If you want a symbolic solution, then no, IDL does not do symbolic manipulation.

If you know values of A, B, THETA and H, then you can probably use a simple procedure like AMOEBA to solve for X. Or better yet, you can probably use some simple iterative approach to solve the problem.

If your goal is to estimate the A, B THETA and H parameters based on your data, then your best bet is to use MPFIT().

Best wishes,
Craig
