The way this is written, 'tmp1' is a scalar string, so N_ELEMENTS should always return 1.

In any case, I think "Illegal variable name" is a bash error because IDL just says "syntax error" when using an invalid variable name:

```
IDL> print, n_elements(3days)
```

```
print, n_elements(3days)
```

```
      ^
```

```
% Syntax error.
```
