Hi all,

I'm trying to write a program for IDL to interpolate grid points. My original dataset contains "spikes" in the data, so I don't want to use polynomial interpolations as this produces instabilities in the interpolated field. Any other form of interpolation would be fine though. I'm currently trying to use the BILINEAR function. My input dataset contains 288 longitudes (1.25 degs.) by 217 latitudes (0.83 deg.). I want to interpolate this to 320 longitudes (1.125 deg.) by 160 latitudes (gaussian grid at about 1.125 deg.). I seems to constantly get the error message "Coordinate arrays must have same length if Grid not set". I haven't come across this error before, and find help less than helpful. Can anyone explain the meaning of this to me? Also, if someone has already tackled a similar problem, I'd be EXTREMELY grateful if you could send me a copy of the program with a brief explanation (if necessary). My email address is:

sheppard@geo.umnw.ethz.ch

Thanks in advance,

Rae
