You probably mean 'function graphics' - 'object graphics' is a different system. I think the extra time is the price you pay for being able to resize, zoom, rotate etc with your results.

I've been using a home-baked system for anti-aliasing direct graphics since before FG. It comes out intermediate between DG and FG:

pro test1

;create some dummy data

x = replicate(0.,11,200)

y = x

FOR i=0,199 DO x[* ,i] = FINDGEN(11)

FOR i=0,199 DO y[* ,i] = RANDOMN(seed,11)

```

;plot in direct graphics
tic
plot,[0,10],[-5,5],/nodata,yrange=[-5,5],ystyle=1
FOR i=0,199 DO oplot,x[*],y[*],i
toc

;plot in object graphics
tic
w = window()
w.REFRESH, /DISABLE
p = plot([0,10],[-5,5],/nodata,yrange=[-5,5],/current)
FOR i=0,199 DO !NULL=plot(x[*],y[*],i,/overplot)
w.REFRESH
toc

;plot in gmwindow
tic
gmw=obj_new("gmwindow")
gmw->plot,[0,10],[-5,5],/nodata,yrange=[-5,5],ystyle=1
FOR i=0,199 DO gmw->oplot,x[*],y[*],i,/no_draw
gmw->draw
toc

```

end

```

IDL> test1
% Time elapsed: 0.094000101 seconds.
% Time elapsed: 3.6379998 seconds.
% Time elapsed: 0.68700004 seconds.

```

Output of all three are here: http://hrscview.fu-berlin.de/mex4/software/idl/gmwindow/direct_vs_function_vs_gmwindow.png

And the gmwindow code, here: <http://hrscview.fu-berlin.de/mex4/software/idl/gmwindow/>

cheers,
Greg
