If you really need the index names, use (ordered) hash variable:
You can use it as normal variables and also loop thru this

```
IDL>dep = findgen(1,500)
IDL>col = orderedhash()
```

```
IDL>for i=0, 9 do $
IDL> col[string(i,form='(i1.1)')+1'] = dep[0,(i*50):((i+1)*50)-1]
```

```
IDL> foreach values, col, name do print,name
IDL> help,col['31']
IDL> print,col['51']
```

A.
