Thank you Zachary. It worked just fine. I have a couple of questions more if you can help me:

1. How do i save in .tiff format (it saves in .dat)
2. How do i invoke tile operations, and lastly
3. What if i want to do this for tons of files

You see, when you begin with a new language without a tutor you don't know where to turn. So, i began with classic IDL introductions, then i read that if you want 'to include ENVI functionality' you can turn to ENVI DOIT routines (probably for those working in Remote Sensing), and then you have this 'object oriented' version of IDL-ENVI, which looks very straight forward, like you say. What to choose? By the way, can you suggest any 'getting started' tutorial, or some other reference (book or other) on this new ENVI API?

Thank you again for your help! Much appreciated.
