My intention is to maintain xc, a 10 element array (0 to 9), with the 10 values of 0,1,2,..9.
Then by calling testDouble, fc becomes a 10 element array (0 to 9) with the 10 values of 0,2,4,6, ..
18 as before.

Now a call is made to testTotal using the same xc values as above. What is the resulting (new)
state of fc? Does fc change from being a 10-element array to a scalar (45)? I presume the xc
values will not be affected by these two calls.

With my thanks
