
Subject: Multiple image plots in postscript

Does anybody know how to put multiple image plots on 1 page in postscript using pvwave CL? I know how to do it in an X window, but it doesn't work when I try it in postscript. When postscript is selected it automatically scales your image to the size of the entire plot area. I tried reducing the size of the plot area by changing the device variables, xsize and ysize. This succeeds in reducing the size of the image plot, but when I try putting a second image on the same page (changing the device parameters xoffset and yoffset so it moves the plot to another part of the page), the second image is ignored by the printer when I try printing it out. In other words, it will only plot the first image and it ignores the second one.

The only way I have discovered to get multiple image plots on the same postscript page is to use the position parameter when calling tv or tvscl, but now the problem is the images are again scaled to the entire size of the plot area.

Having multiple image plots on 1 postscript page seems like a common thing, so I was hoping somebody out there has done it already.

Thanks

Kevin Anderson
