Hey all,

I have a query regarding multiplotting in IDL:

I know how to to multiplot like eg.

```
cgerase & multiplot, [r,b],mXtitle='W', mYtitle='F'
```

will generate $r*b$ plot windows with b columns and r rows,
but if i want to generate my some plots to be specifically get plotted at say
points on window say where my r is odd(say for eg.) or my b say $b>2$.
It could be any condition related to r and b . How to go for it???
Any Idea?
