Hello All,

I have a long float array say b\_arr.  
and I know it has a value 0.999254 at position 4556th in b\_arr  
but when I am doing:

```
i=where( b_arr EQ 0.999254)  
print,i  
-1
```

It should return i=4556. isn't??  
How come is this possible any help please?
