Hello All,

I have a long float array say b_arr.

and I know it has a value 0.999254 at position 4556th in b_arr

but when I am doing:

```
i=where( b_arr EQ 0.999254)
```

```
print,i
```

```
-1
```

It should return i=4556. isn't??

How come is this possible any help please?
