> I am cooking on another DLM. I need to check for the number of parameters passed into the routine but need to distinguish between regular arguments and keywords. The argc argument gives me the total but I do not know how to subtract the keyword count. There must be a simpler way of checking every single keyword as to whether it is supplied or not. Help greatly appreciated.

See the docs for the internal C function IDL_KWProcessByOffset.

Here's an example from the EDG:

http://www.harrisgeospatial.com/docs/KWExamples.html
