
Subject: finding boundary in image having multiple region of interest

Hi all,

I need to select roi having combined pixel area above 3493pixels and intensity above 1.25.

I tried using find_boundary which gives the pixel area for pixels above the threshold for one roi that we give as input. But in one image I have multiple rois to be selected. so find_boundary will not work.

I have several images like this.

So do anyone have any idea to do this.

The threshold should be the intensity should be more than 1.25 and the combined pixel area should be greater than 3493 pixels.

thanks
