---

I have two images I have to align one image with respect to the other,

I have two solar images size is 2048 by 2048. But the problem is in one image the data resolution is 1.0648 arcsec/pixel and other is 1.2 arcsec/pixel

So due to this in xaxis the data coverage is 1700pixels(out of 2048 pixels) in imagea

in imageb the data coverage is 1900 pixels(out of 2048 pixels)

I want imageb with resolution and data coverage as imagea.

please do help me out in this regard.

Note: I have 500 images (like imageb) which i have to bring to imagea resolution.

thanks
