Are you sure want to use TS_SMOOTH() rather than the much more commonly used SMOOTH() function? Actually, if you are using a central moving average (the default) in TS_SMOOTH(), then it gives the same results as SMOOTH() away from the end points. And SMOOTH() does have a /NAN keyword.

If you really do have a time series with NaN values, and want to compute an autoregressive model, then you could edit the code to ts_smooth.pro. But it is not clear how one would want to handle NaN values in that case.
