Hey,

I had a similar problem by integrating an IDL-based stand-alone program in an automatic procedure in R.

To confirm this disturbing window, I used the sendKeys.bat-file by npocmaka.

This IDL window was named "Runtime App" in my case, so I could address this window by the following system command: (PATH)\sendKeys.bat "Runtime APP" "{ENTER}".

Therefore, I created a new (.bat) file that, at first, opens the IDL-based program and then, confirmed the IDL window by sendKeys.bat.

Unfortunately, I do not know if it is possible to call system commands in IDL. In R it is easily done by system(...).

Hope that helps.

Here the link to the above mentioned file and forum talk (11-28-2016):
