Hi everyone,

Has anyone used CALL\_EXTERNAL under linux with the g77 compiler?  
I compiled, then linked the FORTRAN with

```
g77 -o test.so -shared $(OBJS) -lm
```

with no errors. When I do the CALL\_EXTERNAL (which works on IRIX  
and VMS), I get

```
/usr/local/rsi/idl_5/bin/bin.linux/idl: can't resolve symbol '__moddi3'
```

at a WRITE (6, \*) statement in the FORTRAN. Anyone have any idea  
where that symbol should be defined or what it means (it is not  
part of my code)?

-bob

```
{ x86 linux unix 5.0 Apr 28 1997 }
```
