
Subject: 2D Array with a different value for every country

I would like to fold plumes of air pollutants with emissions of these pollutants ("fold" = hadamard product in this case). My plumes are 2D Arrays, with longitudes and latitudes as coordinates. Since I have emission factors for specific countries, I would like to make another 2D array with the known emission factors. For example all dots within France would have the value 0.55.

Do you have an idea how to do that?
Thank you,
Clara
