Hi,

I have a 1D array with an odd number of rows, e.g. `A=indgen(2435)`.

I want to split the array A into two parts and first access the entries `A[0:1217]` and then `A[1218:*`].

Then I would like to split my array into 4 parts and access each part every time.  
Then split the matrix into 8 parts and so on.

Can anyone help with that?

Thanks in advanced.
