The details of this would look different depending on the platform and there are some ugly hacks here, but the basic premise can be done.

Result on Mac OS (probably the ugliest):

http://michaelgalloy.com/wp-content/uploads/2017/08/mg_widget_label_demo.png

Code:

```
pro mg_widget_label_demo
  compile_opt strictarr

  tlb = widget_base(/column, xpad=5, ypad=5)

  base = widget_base(tlb)

  label = widget_label(base, value='Conversion Parameters', xoffset=5,
yoffset=0)

  framed_base = widget_base(base, /column, frame=1, xoffset=0, yoffset=8)
  content = widget_base(framed_base, xsize=300, ysize=300)

  base = widget_base(tlb, /row, /base_align_center)

  icon1 = widget_draw(base, xsize=20, ysize=20)
  slider = widget_slider(base, xsize=150, /suppress_value)
  icon2 = widget_draw(base, xsize=20, ysize=20)
  text = widget_text(base, xsize=4, ysize=1, value='38')
```

```
widget_control, tlb, /realize  
end
```

Mike
