Hi

I recently upgrade ma machine with Ubuntu 16.04 and I had some difficulty to run my IDL8.2
licence on it. After several exchanges with IDL help desk I can run it but if I reboot the machine I
have to follow a protocol to kill some processes, wait to open a port and run the lmgrd prog. I
would like to know if there is a way to do that automatically ? Thanks

```
$ mkdir /usr/tmp/
$ cd /usr/tmp
$ touch .flexlm
$ chmod 666 .flexlm
```

After that finalize lmgdr pendence:
```
$ killall lmgrd
$ killall idl_lmgrd
```

Do it again after 30s to be sure that all executable were closed.

Then wait for a 1min, necessary for the system open ports 1700 and 1701, and then run:

```
$ /usr/local/exelis/idl82/bin/bin.linux.x86/lmgrd -c /usr/local/exelis/license/license.dat -l
/usr/local/exelis/license/lmgrd.log &
```
